```
from sklearn.datasets import fetch openml
from sklearn import metrics
from sklearn.model_selection import train_test_split
import pandas as pd
import datetime
x1 = datetime.datetime.now()
print(x1)
    2019-12-06 21:54:12.049991
Г→
mnist = fetch_openml('mnist_784', version=1, cache=True )
#mnist
mnist.data.shape
     (70000, 784)
Гэ
mnist.target.shape
    (70000,)
Г⇒
# test_size: what proportion of original data is used for test set
train_img, test_img, train_lbl, test_lbl = train_test_split(
   mnist.data, mnist.target, test size=1/7.0, random state=0)
print(train_img.shape)
    (60000, 784)
print(train_lbl.shape)
    (60000,)
Г⇒
print(test_img.shape)
    (10000, 784)
print(test_lbl.shape)
     (10000,)
from sklearn.preprocessing import StandardScaler
scaler = StandardScaler()
```

```
# Fit on training set only.
scaler.fit(train_img)

# Apply transform to both the training set and the test set.
train_img = scaler.transform(train_img)
test_img = scaler.transform(test_img)
```

▼ Step 1: Import the model you want to use

In sklearn, all machine learning models are implemented as Python classes

```
from sklearn import svm clf = svm.SVC(gamma=0.001, C=100) # các tham số cho mô hình hoạt động tốt hơn
```

Step 2: Training the model on the data, storing the information learned from the data
 Model is learning the relationship between x (digits) and y (labels)

Measuring Model Performance

accuracy (fraction of correct predictions): correct predictions / total number of data points

Basically, how the model performs on new data (test set)

▼ Step 3: Predict the labels of new data (new images)

Uses the information the model learned during the model training process
